Merge reliable-message-delivery-344

Author: exarkun

Reviewer: moe

Fixes #344, #413, #513, #514, #700, #705, #738; Refs #735

- Nit's command line is extended to accept a port number on which to run its webserver.
- The transport layer of Athena is replaced with a message-queue based mechanism. This supports gap and duplicate message detection, allowing the server to leave the page "connected" for a short while even if a client abruptly closes its connection(s). This should provide greater stability in the face of poor network conditions and various kinds of proxy misbehavior.
- All messages sent from the server while synchronously handling a message from the client are bundled up and sent in a single response, rather than putting each message into its own response. Likewise, messages sent from the client while synchronously handling a message from the server or synchronously handling a DOM event using <athena:handler> will also be bundled up in one request.
- Only one transport resource instance is created per LivePage, instead of one per request.
- The guaranteed namespace-aware getAttribute helper has been moved into the runtime support code.
- Several problems with error reporting on IE in the test suite have been fixed.

- A lingering usage of MochiKit Deferreds has been removed.
- Escape is now captured and handled with an explicit close message.
- If a page is unloaded because the user navigated to another page, the disconnect dialog is no longer displayed.
- The client-side debug log displays slightly more nicely.
- Radical once again avoids using active channels and constructs cacheable URLs for javascript modules.
